342 A platform of bamboo is next constructed at an
[319] elevation of two or three feet from the ground. The
314 split green leaves, prepared as above, are then placed on this platform and a thatch built over and around them so as to protect them completely from the weather. This is done usually at the place where the leaves are cut, probably more as a matter of convenience than for any other reason, since the leaves when green are very heavy but on drying become very light. They are allowed to season here for at least two months, after which they are transported to the point where they are to be used. In some cases, however, the freshly cut leaves are transported at once to the house for which they are intended and there cured.

This seasoning in a dry place is absolutely necessary, since if the leaves were placed on the roof while still green, the constant rains of this region would soon rot
[325] them. It is further claimed that if used when green they are soon attacked by insects, especially cockroaches, which, as before mentioned, are very numerous and troublesome.

342 The negroes also use the tagua-leaf to a large extent
177 for thatch, and in its preparation they are very strict in their observance of certain rules concerning the phases of the moon. No timber may be felled and no thatch leaves cut in the light of the moon. In the case of timber, it is claimed that it is both subject to the attacks of insects and is rendered much more likely to break or split in working if cut in the light of the moon than if cut in the dark of the moon. Likewise thatch
